

Day 30(5) Bitwise operators (most imp)

⇒ The purpose of Bitwise operators is that "to perform various operations on the integer data in various fields like set operations complex math operations comparisons etc. in the form of Bit by Bit."

⇒ Bitwise operators are applicable only on integer data but floating point values bcoz integer data contains certainty where floating point values does not contain certainty.

⇒ The Execution process of Bitwise operators is that

• (i) Bitwise operators converts the given integer data into Binary format.

• (ii) Bitwise operators perform operations on Binary data in the form of Bit by Bit depends on type of Bitwise operator we apply.

• (iii) The Result of Bitwise operators is available internally in the form of ~~binary~~ Binary and we display the result then it show to end user in the form of Decimal Number system (default number system).

⇒ Since the Bitwise operators perform the operations in the form of Bit by Bit and Hence they named as Bitwise operators.

⇒ In Python programming we have 6 types of Bitwise operator.

<u>SLNo.</u>	<u>SYMBOL</u>	<u>MEANING</u>
1.	<<	Bitwise <u>Left shift</u> operator
2.	>>	Bitwise <u>Right shift</u> operator
3.	&	Bitwise <u>AND</u> operator
4.		Bitwise <u>OR</u> operator
5.	~	Bitwise <u>Complement</u> operator
6.	^	Bitwise <u>XOR</u> operator

(1) Bitwise left shift operator (<<)

Syntax = Given Number << No. of Bits

⇒ The execution process of Bitwise leftshift operator (<<) is that "it moves Number of Bits towards left side by Adding Number of zeroes (Number of zeroes = Depending No. of bits we flipped-off) at Right side."

Examples

```
>>> a = 10
>>> b = a << 3
>>> print(b) --- 80
>>> print(4 << 3) --- 32
>>> print(9 << 2) --- 36
>>> print(10 << 0) --- 10
>>> print(10.3 << 2) --- TypeError
```

$$4 \times 2^3 = 4 \times 8 = 32$$

>>> a = 10 --- 16 bit Register --- a = 10.

0000	0000	0000	1010
------	------	------	------

>>> b = a << 3 --- 16 bit register --- a = 10

0000	0000	0000	1010
------	------	------	------

←←←

b ---

0000	0000	0101	0000
------	------	------	------

Result is 80

>>> print(b) --- 80.

formula:-

Varname = Given Number << No. of Bits
 Varname = Given Number $\times 2^{\text{No. of Bits}}$

```
>>> print(2 << 3) --- 16
>>> print(3 << 2) --- 12
>>> print(4 << 2) --- 16
```

$$2 \times 2^3 = 2 \times 8 = 16$$

(11) Bitwise Rightshift operator (>>)

Syntax : $\text{varname} = \text{Given Data} \gg \text{No. of Bits}$

=> The execution process of Bitwise Rightshift operator (>>) is that "it moves number of Bits Towards Right side by Adding Number of zeroes (Number of zeroes = Depending No. of bits we flipped - off) at left side."

Examples:

```
>>> a = 10
>>> b = a >> 3
>>> print(b) --- 1
>>> print(16 >> 2) --- 4
>>> print(32 >> 3) --- 4
>>> print(32 >> 0) --- 32
>>> print(80.5 << 4) --- TypeError
```

$$10 \gg 3 = \frac{10}{2^3} = \frac{10}{8} = 1.25$$

$$16 \gg 2 = \frac{16}{2^2} = \frac{16}{4} = 4$$

examples

a = 10 - 16 Bit Register.

>>> a = 10 --->

0 0 0 0	0 0 0 0	0 0 0 0	1 0 1 0
---------	---------	---------	---------

>>> b = a >> 3 --->

0 0 0 0	0 0 0 0	0 0 0 0	1 0 1 0
---------	---------	---------	---------

↘ ↙

flipped off

b --->

0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 1
---------	---------	---------	---------

>>> print(b) ---> 1.

formula:

$$\text{result} = \frac{\text{Given Data}}{2^{\text{No. of Bits}}}$$

in python ---> $\text{Given Data} // 2^{\text{No. of Bits}}$

```
>>> print(16 >> 2) --- 4
>>> print(32 >> 3) --- 4.
```

(III) Bitwise AND operator (&)

Syntax :-

Var1 & Var2

(अगर अगर Var 1 → 1 होगा तो 1 होगा)

⇒ The functionality of Bitwise AND operator (&) is shown below

<u>Var1</u>	<u>Var2</u>	<u>Var1 & Var2</u>
0	0	0
0	1	0
1	0	0
1	1	1

Examples

>>> a = 4 - - - - 0100.

>>> b = 3 - - - - 0011

>>> c = a & b - - - - 0000.

0100
And 0011

0000

maxtime >>> print(c) - - - 0

>>> print(10 & 15) - - - 10.

>>> print(15 & 10) - - - 10

>>> print(30 & 20) - - - 20

>>> print(20 & 30) - - - 20.

>>> 30 and 20 - - - 20

>>> 20 and 30 - - - 20

→ >>> s1 = {10, 20, 30}

>>> s2 = {15, 20, 35}

>>> s3 = s1 & s2

>>> print(s3, type(s3)) - - - {20} <class 'set'>

>>> s1 = {"Apple", "Mango"}

>>> s2 = {"Mango", "Kiwi"}

>>> s3 = s1 & s2

>>> print(s3, type(s3)) - - - {'Mango'} <class 'set'>

```

>>> S1 = {1,2,3,4}
>>> S2 = {4,5,6,7}
>>> S3 = S1 & S2
>>> print(S3, type(S3)) - - - set() <class 'set'>
>>> "Apple" & "Mango" - - - Type error.
>>> "apple" and "mango" - - - 'mango'
>>> 1.2 & 3.4 - - - Type error
>>> 1.2 and 3.4 - - - 3.4

```

(IV) Bitwise OR operator (|)

Syntax: $\text{Var1} | \text{Var2}$

(0 और 1 variable की
1 और 1 के लिए 1 होता है)

=> The functionality of Bitwise OR operator (|) is shown below.

<u>Var1</u>	<u>Var2</u>	<u>Var1 Var2</u>
0	0	0
0	1	1
1	0	1
1	1	1

Examples.

```

>>> a = 4 - - - 0100.
>>> b = 3 - - - 0011.
>>> c = a | b - - - 0111 - result is 7
>>> a = 5
>>> b = 4
>>> c = a | b
>>> print(c) - - - 5.
>>> print(10 | 15) - - - 15
>>> print(15 | 10) - - - 15
>>> print(30 | 20) - - - 30
>>> print(20 | 30) - - - 30.
>>> 30 or 20 - - - 30
>>> 20 or 30 - - - 30.

```

most imp

```
>>> s1 = {10, 20, 30}
```

```
>>> s2 = {15, 20, 35}
```

```
>>> s3 = s1 | s2
```

```
>>> print(s3, type(s3)) — — — {10, 20, 30, 15, 35} <class 'set'>
```

```
>>> s1 = {"Apple", "Mango"}
```

```
>>> s2 = {"Mango", "Kiwi"}
```

```
>>> s3 = s1 | s2
```

```
>>> print(s3, type(s3)) — — — {"Apple", "Mango", "Kiwi"} <class 'set'>
```

=

```
>>> s1 = {1.2, 3.4}
```

```
>>> s2 = {4.5, 6.7}
```

```
>>> s3 = s1 | s2
```

```
>>> print(s3, type(s3)) — — — {1.2, 3.4, 4.5, 6.7} <class 'set'>
```

=

```
>>> "Apple" | "Mango" — — — TypeError
```

```
>>> "apple" or "mango" — — — 'apple'
```

```
>>> 1.2 | 3.4 — — — TypeError
```

```
>>> 1.2 | 3.4 — — — 1.2
```

Day(31)(X) Bitwise Complement operator (~)

Syntax :- $\text{varname} = \sim \text{Given Number.}$

=> The Execution process of Bitwise Complement operator (~) is that "It inverts the given bits".

=> Inverting the bits is nothing but 1 becomes 0 and 0 becomes 1.

=> The formula for Bitwise Complement operator (~) is given below

$$\sim \text{Given Number} = -(\text{Given Number} + 1)$$

Example

```
>>> a = 10
```

```
>>> print(~a) - - - - - 11
```

```
>>> a = 100
```

```
>>> print(~a) - - - - - 101
```

```
>>> a = 123
```

```
>>> print(~a) - - - - - 122
```

Q) Prove that ~10 is -11 (Internal process of).
-ve number = 2's complement

proof:- Given $\sim 10 = -11$

Here -11 is the opposite counter part of 11
• Given Number 10 whose Binary part is 1010

$\Rightarrow \sim 10 = \sim (1010) = 0101$ (which is the Binary form of -11 which is the 2's complement 11).

Note: All the negative numbers are 2's complement of their +ve numbers.

example: 10 whose counter part is -10 -- which is 2's complement of 10.

$\Rightarrow$ Here -11 is the opposite counter part of 11 (2's complement of 11).

$\Rightarrow$ All negative Number stored in main memory in the form of 2's complement (2's complement = 1's complement + 1)

$\Rightarrow$ Here we take 11 and whose Binary Form is 1011
(1's complement of any Number = 1 becomes 0 & 0 becomes 1)

$\Rightarrow$ 1's complement of 11 is - - - - 0100

$\Rightarrow$ 2's complement of 11 is - - - 1's complement of 11 + 1
= 0101

$\Rightarrow$ 0101 -- which is 2's

complement of 11 -- result is -11

$\Rightarrow$ 0001 ~~addition~~
~~0001 + 0001 = 0010~~
~~0010 + 0001 = 0011~~
~~0011 + 0001 = 0100~~
~~0100 + 0001 = 0101~~
~~0101 + 0001 = 0110~~
~~0110 + 0001 = 0111~~
~~0111 + 0001 = 1000~~
~~1000 + 0001 = 1001~~
~~1001 + 0001 = 1010~~
~~1010 + 0001 = 1011~~
~~1011 + 0001 = 1100~~
~~1100 + 0001 = 1101~~
~~1101 + 0001 = 1110~~
~~1110 + 0001 = 1111~~
~~1111 + 0001 = 10000~~
~~10000 + 0001 = 10001~~
~~10001 + 0001 = 10010~~
~~10010 + 0001 = 10011~~
~~10011 + 0001 = 10100~~
~~10100 + 0001 = 10101~~
~~10101 + 0001 = 10110~~
~~10110 + 0001 = 10111~~
~~10111 + 0001 = 11000~~
~~11000 + 0001 = 11001~~
~~11001 + 0001 = 11010~~
~~11010 + 0001 = 11011~~
~~11011 + 0001 = 11100~~
~~11100 + 0001 = 11101~~
~~11101 + 0001 = 11110~~
~~11110 + 0001 = 11111~~
~~11111 + 0001 = 100000~~
~~100000 + 0001 = 100001~~
~~100001 + 0001 = 100010~~
~~100010 + 0001 = 100011~~
~~100011 + 0001 = 100100~~
~~100100 + 0001 = 100101~~

Q. prove that ~ 16 is -17

Proof:- Given $\sim 16 = -17$

Here -17 is the opposite counter part of 17

$\Rightarrow$ Given Number 16 and whose binary part is $0001\ 0000$

$\Rightarrow \sim 16 = \sim (0001\ 0000) = 1110\ 1111$ (which is the binary form of -17)

$\Rightarrow$ Here -17 is the opposite counter part of 17

$\Rightarrow$ All Negative Number stored in main memory in the form 2's Complement (2's Complement = 1's Complement + 1)

$\Rightarrow$ Here we take 17 and whose binary form is $0001\ 0001$
(1's Complement of any number = 1 becomes 0 & 0 becomes 1)

$\Rightarrow$ 1's Complement of 17 is $1110\ 1110$

$\Rightarrow$ 2's Complement of 17 is $1110\ 1110$ + 1's Complement of 17 + 1

$\Rightarrow 0000$

$1110\ 1110$

$0000\ 0001$

(Binary Addition rules (0+0, 1+0=1, 0+1=1, 1+1=0 with carry 1).

$1110\ 1111$

Q. prove that ~ 15 is -16

Proof:- Given $\sim 15 = -16$

Here -16 is the opposite counter part of 16

$\Rightarrow$ Given Number 15 and whose binary part is $0000\ 1111$

$\Rightarrow \sim 15 = \sim (0000\ 1111) = 1111\ 0000$

(which is the binary form of -16)

$\Rightarrow$ Here -16 is the opposite counter part of 16

$\Rightarrow$ All Negative Number stored in main memory in the form 2's Complement (2's Complement = 1's Complement + 1)

$\Rightarrow$ Here we take 16 and whose binary form is $0001\ 0000$

(1's Complement of any Number = 1 becomes 0 & 0 becomes 1)

$\Rightarrow$ 1's Complement of 16 is $1110\ 1111$

$\Rightarrow$ 2's Complement of 16 is $1110\ 1111$ + 1's Complement of 16 + 1

$\Rightarrow$

$$\begin{array}{r} 1110 \\ 0002 \end{array} \begin{array}{r} 1111 \\ 0001 \end{array} \text{ Binary Addition}$$
 $(0+0=0, 1+0=1, 0+1=1, 1+1=0 \text{ with carry } 1)$
 $1111 \cdot 0000$ (which is the Binary Form of -16)

(X) Bitwise XOR operator (^)

* In-process of Bitwise Complement operator: -

$$-(b+1)$$

$\gg a = 10 \rightarrow 1010$ (Inverting the bits)

$\gg b = \sim a \rightarrow 0101$ - - - - it is the result of (-11)

Proof:

$\Rightarrow$ Given Number is 11 - - - Binary - - - $\rightarrow 1011$

$\Rightarrow$ 1's Complement of 11 - - - - $\rightarrow 0100$ (Inverting the bits)

$\Rightarrow$ 2's Complement of 11 = 1's Complement of 11 + 1

$$= 0100 + 1$$

$$= 0101$$

$$+ 0001$$

$$\hline 0101$$

- - - 2's Complement of 11 (-11)

(XI) Bitwise XOR operator (^)

Syntax: $\text{Varname} = \text{value1} \wedge \text{value2}$

The functionality of Bitwise XOR operator (^) is expressed with the following Truth Table.

Both same
value rahega
to 0
or both different
rahega 1

Value1	Value2	Value1 ^ Value2
0	0	0
0	1	1
1	0	1
1	1	0

Examples:

$\gg \text{print}(2 \wedge 3) \rightarrow 1$

$\gg \text{print}(10 \wedge 15) \rightarrow 5$

Special points ← Bitwise Number different hai hai ①.

```
>>> s1 = {10, 20, 30}
```

```
>>> s2 = {15, 20, 25}
```

```
>>> s3 = s1.symmetric_difference(s2)
```

```
>>> print(s3, type(s3)) - - - - {10, 15, 25, 30} <class 'set'>
```

```
= >>> s1 = {10, 20, 30}
```

```
>>> s2 = {15, 20, 25}
```

```
>>> s3 = s1 ^ s2 # Bitwise XOR operator (^)
```

```
>>> print(s3, type(s3)) - - - - {10, 15, 25, 30} <class 'set'>
```

```
= >>> s1 = {"Apple", "mango", "kiwi"}
```

```
>>> s2 = {"sberry", "mango", "Guava"}
```

```
>>> s3 = s1 ^ s2
```

```
>>> print(s3, type(s3)) - - - - {'Guava', 'apple', 'kiwi', 'sberry'}
                                     <class 'set'>
```

```
>>> {1.2, 2.3, 3.4} ^ {1.2, 2.3, 4.5} - - - {3.4, 4.5}
```

```
>>> 1.2 ^ 2.3 - - - - TypeError.
```

```
>>> "apple" ^ 1.2 - - - - TypeError.
```

Simple logic - - - - swapping of two integer values: -

```
>>> a = 3
```

```
>>> b = 4
```

```
>>> print(a, b) - - - - 3 4
```

```
>>> a = a ^ b
```

```
>>> b = a ^ b
```

```
>>> a = a ^ b
```

```
>>> print(a, b) - - - - 4 3
```

swap.

```
a = int(input("Enter value of a:"))
b = int(input("Enter value of b:"))
print("\n" * 50)
print("original value of a = {}".format(a))
print("original value of b = {}".format(b))
print("\n" * 50)
```

swapping logic

```
a = a ^ b
b = a ^ b
a = a ^ b
print("swapped value of a = {}".format(a))
print("swapped value of b = {}".format(b))
print("\n" * 50)
```

swap with Addition.

```
a = int(input("Enter value of a:"))
b = int(input("Enter value of b:"))
print("\n" * 50)
print("original value of a = {}".format(a))
print("original value of b = {}".format(b))
print("\n" * 50)
```

swapping logic with XOR

```
a = a + b
b = a - b
a = a - b
```

same logic

a = 5, b = 3

a = 5 + 3 = 8

b = 8 - 3 = 5

a = 8 - 5 = 3

third variable

```
t = a
a = b
b = t
```

5.Bitwise operators

- in python programming we have 6 types of bitwise operators:
- 1.Bitwise left shift operator
- 2.Bitwise right shift operator
- 3.Bitwise and operator

- 4.Bitwise or Operator
- 5.Bitwise complement operator
- 6.Bitwise XOR operator

1.Bitwise left shift operators:

- syntax:= Given Number<< No.of Bits

```
In [1]: a=10  
b=a<<3  
print(b)
```

80

```
In [2]: print(4<<3)
```

32

```
In [3]: print(9<<2)
```

36

```
In [4]: print(10<<0)
```

10

```
In [5]: print(10.3<<2) #
```

```
-----  
TypeError                                Traceback (most recent call last)  
Cell In[5], line 1  
----> 1 print(10.3<<2)  
  
TypeError: unsupported operand type(s) for <<: 'float' and 'int'
```

2.Bitwise Right shift Operators:

- syntax:= varname=Given data >> no.of Bits

```
In [7]: a=10  
b=a>>3  
print(b)
```

1

```
In [8]: print(16>>2)
```

4

```
In [9]: print(32>>3)
```

4

```
In [10]: print(32>>0)
```

32

3.Bitwise And Operator

- syntax:= var1 & var2

```
In [11]: a=4  
        b=3  
        c=a&b  
        print(c)
```

0

```
In [12]: print(10&15)
```

10

```
In [13]: print(15&10)
```

10

```
In [14]: print(30&20)
```

20

```
In [15]: print(20&30)
```

20

```
In [16]: 30 and 20
```

Out[16]: 20

```
In [17]: 20 and 30
```

Out[17]: 30

```
In [18]: s1={10,20,30}  
        s2={15,20,35}  
        s3=s1&s2  
        print(s3,type(s3))
```

{20} <class 'set'>

```
In [19]: s1={"apple","mango"}  
        s2={"mango","kiwi"}  
        s3=s1&s2  
        print(s3,type(s3))
```

{'mango'} <class 'set'>

```
In [20]: s1={1.2,3.4}  
        s2={4.5,6.7}  
        s3=s1&s2  
        print(s3,type(s3))
```

set() <class 'set'>

```
In [21]: "Apple"&"mango"
